The supplementary document provides 1) details of our annotation tools; 2) system implementation details; 3) intermediate results by pre-processing networks; 4) visualization of what our arrangement classifier learned; and 5) more experimental results.

1. Annotation tools

We use two annotation tools to create annotations at the level of panoramas and at the level of houses/apartments. Both tools are implemented with PyQt5 and Python.

Panorama-level Annotator: We used a modified version of PanoAnnotator [1] to annotate room type, room layout, and door/window bounding-boxes/segmentations. We fix the layout height to 3.2 and allow the specification of different object types. Figure 1 shows its screenshot.

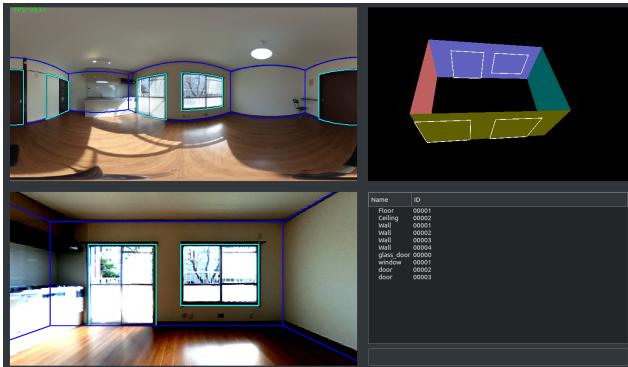

Figure 1. Panorama-level Annotator

House-level annotator: We implemented an annotation toolbox to add, rotate, and move the nadir semantic images on the floorplan image. The toolbox also allows the rescaling of the floorplan image. The 2D positions and the heading angles are annotated with respect to the floorplan. Figure 2 shows its screenshot.

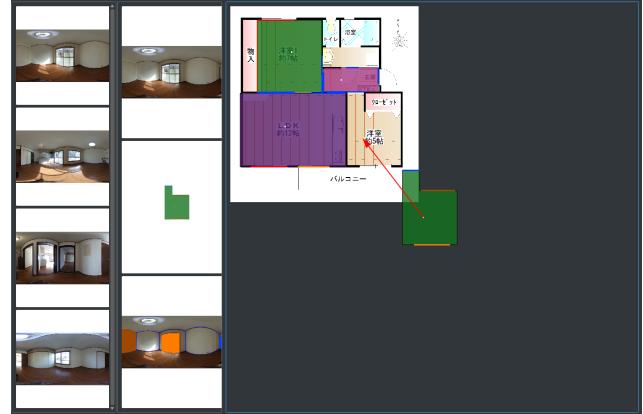

Figure 2. House-level Annotator

2. System details

Table 1 provides the architecture specifications of our arrangement evaluator. The network takes an arrangement of size $256 \times 256 \times 16$ as the input. Each convolutional layer has a kernel of size 3×3 with padding and stride of 1. The GroupNorm layers [2] have 4 groups except the last Group-Norm layer which has only 1 group.

3. Intermediate results

Figure 5 shows the intermediate results by pre-processing networks, namely, room layouts, door/window type/detections/segmentations, and the Nadir semantic images. Estimated layouts are visualized by the implementation of HorizonNet [1]. In addition, Figure 3 shows the confusion matrix obtained from the room classifier network over the test set. The largest confusion happens between the dining room and Western-style room when the room is large and connected to the kitchen. In these cases, it could be considered as both dining room or western-style room

Table 1. Our arrangement evaluator architecture, which is shown in the top table as the list of modules. The bottom table shows that each module consists of a list of layers.

Modules	Resolutions
ConvSet 32	$256 \times 256 \times 32$
MSP 32	$256 \times 256 \times 32$
DownSampling 64	$128 \times 128 \times 64$
MSP 64	$128 \times 128 \times 64$
DownSampling 128	$64 \times 64 \times 128$
MSP 128	$64 \times 64 \times 128$
DownSampling 256	$32 \times 32 \times 256$
MSP 256	$32 \times 32 \times 256$
DownSampling 128	$16 \times 16 \times 128$
MSP 128	$16 \times 16 \times 128$
DownSampling 1	$8 \times 8 \times 1$
Flatten	1×64
Linear [64×1]	1

Module	Layers
ConvBlock C	Convolution C
	GroupNorm
	ReLU
ConvSet C	ConvBlock C
	ConvBlock C
MSP C	MessagePassing
	ConvSet C
DownSampling C	MaxPooling
	ConvSet C

based on the main overview of the house.

Figure 3. Confusion matrix obtained from our panorama classifier.

4. What the arrangement classifier learned

Figure 4 visualizes what the arrangement classifier learned with a simple experiment. We take a panorama arrangement and moves around a particular panorama/room

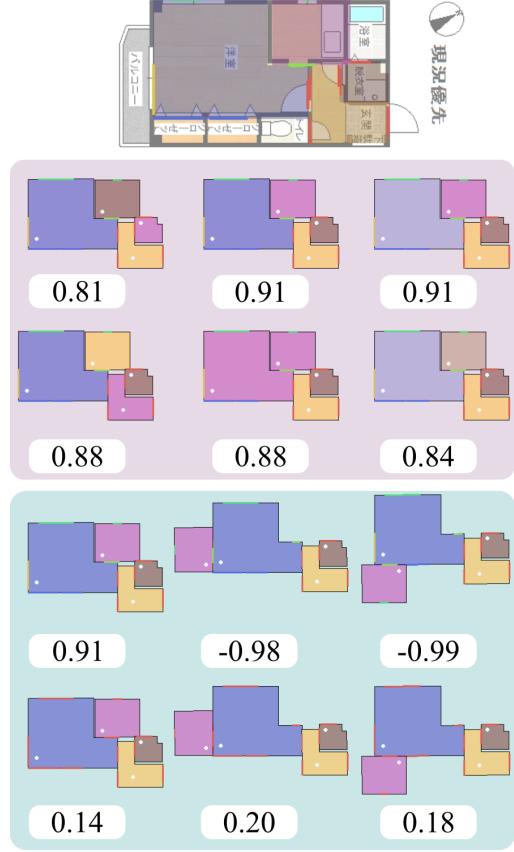

Figure 4. Visualization of what the arrangement classifier learned based on the room (pink box) and door types (green box). Each number shows the predicted score of the evaluator network given the corresponding input.

while observing the evaluation scores. This simple experiment reveals that the scores goes down when the room types in the arrangements are not a standard way or the door types are not provided properly. As it is shown in the second row of the green box in Figure 4, when we consider all of the doors as a same category, the network can not distinguish the positive arrangement (first column) among the three arrangements. However, this is significantly different when we have the corosponding class of each door (first row).

5. More experimental results

Figure 6 shows comparisons against the three competing methods for more test samples in the same format as Fig. 8 in the main paper. Figure 7 shows qualitative evaluations for more test samples in the same format as Fig. 9 in the main paper.
